Surplus computing power  

$$\begin{aligned}
SCP(t,k) = kn- \int_{i \in FR(t,k)} Ci(t) \\
i \in FR(t,k)
\end{aligned}$$
Theorem: If all tasks are released at time 0, then corn  
SCP(0,k) \ge 0 for all k>0 is a necessary and sufficient  
condition for schedulability.  
Use that ket we deadline is twisted uring LLF.  
Frof by induction and t'  
1) SCP(t,k) 7:0 Hk => # of taken an the  
c-axis is  $z h$ .  
2) SCP(t(k) 7:0 Hk implies that  
scr (t+1,k) 7:0 Hk implies that  
scr (t+1,k) 7:0 FK implies that  
scr (t+1,k) 7:0 => n 7:  $\int (i(t) + \int (1-1i(t))$   
is FR(t(1)) is eR(t(n))  
H f Have an c-axin.

Scheduling idea
1. Divide the time line into time slices such that each period of each process is divided into an integral number of time slices. Slice length $T = GCD(T_1,, T_n)$ .
2. Within each time slice, allocate processor time in proportion to the utilization $U_i = \frac{C_i}{T_i}$ originating from the various tasks. Processing time per slice $r_i = TU_i = T\frac{C_i}{T_i}$ . Hence, each task runs $\frac{T_i}{T}r_i = \frac{T_i}{T}T\frac{C_i}{T_i} = C_i$ time units within its period.
<ul> <li>3. Allocate r<sub>i</sub> according to the following algorithm <ul> <li>(a) Look for the first processor proc<sub>j</sub> that has free capacity in its time slices.</li> <li>(b) Allocate that portion of r<sub>i</sub> to proc<sub>j</sub> that proc<sub>j</sub> can accommodate.</li> <li>(c) If all of r<sub>i</sub> has been allocated then proceed with the next task (goto step a).</li> <li>(d) Otherwise allocate the remainder of r<sub>i</sub> to proc<sub>j+1</sub>. proc<sub>j+1</sub> has enough spare capacity as it has not previously been used and r<sub>i</sub> ≤ T due to U<sub>i</sub> ≤ 1. Furthermore, due to r<sub>i</sub> ≤ T, we don't generate temporal overlap between the two partial runs of task i.</li> </ul> </li> </ul>
